(54) Title: PROCESS FOR PREPARING CONCENTRATE THICKENER COMPOSITIONS

(57) Abstract: A process for thickening liquid food and/or medications of people with swallowing problems which involves dilution of a concentrate thickener paste which has been thickened to several times its normally useful and cost-effective levels. The approach is beneficial in formulations intended for radiological evaluations of people with swallowing problems including those persons suffering from dysphagia.

WO 03/011051 A1

PROCESS FOR PREPARING
CONCENTRATE THICKENER COMPOSITIONS

[0001] This application claims the benefit of priority of pending U.S. provisional application 60/309,764 filed August 2, 2001 which is incorporated herein in its entirety by reference.

BACKGROUND OF THE INVENTION

[0002] The present invention relates to concentrate thickener compositions. More particularly the invention relates to xanthan gum concentrate compositions.

[0003] Swallowing problems in humans include difficulty in swallowing, inability to swallow, and discomfort in swallowing. These problems are collectively termed dysphagia. Dysphagia is a common unfortunate secondary condition that accompanies many primary human disease states such as stroke, multiple sclerosis, asperger syndrome, esophageal cancer, laryngeal cancer, chagus disease cystic fibrosis, Huntington's chorea, amyotrophic lateral sclerosis, Parkinson's disease, Riley-Day syndrome, scleroderma, and Alzheimer's disease. In some instances dysphagia occurs due to a birth defect. In pre-term infants, dysphagia may occur simply because the musculature and anatomy involved in swallowing has not yet fully developed.

[0004] Dysphagia is pervasive as between about 5 and about 15 million people in the United States suffer from dysphagia. People with dysphagia generally lack proper muscle control and coordination to properly seal the windpipe or they lack the ability to properly propel the bolus of food and/or beverage to the stomach. If this condition goes unnoticed, sufferers are prone to foodstuff(s) and beverages going into the sufferer's lungs rather than being routed properly to their stomach. When routing to the lungs occurs, the patient sufferer is at increased risk for growing unhealthy bacteria in the lungs which raises the prospect of aspiration pneumonia (with its accompanying attendant risks and hospitalization) and/or even fatal asphyxiation.

[0005] About 30% to about 50% of persons with dysphagia would benefit from a thickened diet. Thin fluids like water move so rapidly through the human swallowing process and they have the least body or texture. Controlling the bolus with these fluids can be very difficult. Any delayed or slowed movement and/or coordination during the swallowing process will more likely be a problem with a thin fluid because it moves so quickly through the mouth and into the throat. The lack of body or texture means that thin fluids are less likely to create the stimulation necessary for proper swallowing in people with dulled swallowing sensation. By thickening fluids intended to be eaten by a person afflicted with dysphagia, it is possible to slow the progress of the fluid through the throat, to produce a bolus that is easier to control, and/or to increase the body or texture of the fluid to increase the likelihood of generating the necessary stimulation for proper swallowing. A major benefit of such thickened fluids and thickened compositions is that when any fluid is left behind in the throat, its thickness will resist flowing into the windpipe. Future swallows can then move the fluid that was left behind into the stomach.

[0006] In institutions and homes where beverages are prepared for persons with dysphagia the mixing equipment used is typically less than ideal. Hand mixing with forks, spoons, stirrers, whisks, etc. is common. Dispersion is also not ideal. The powder is often measured, dumped into the container and then mixing started. At best, some people will add the powder while mixing. Rapid and efficient hydration is nearly impossible.

[0007] Typical dry powder products include Thick-It (Precision Foods, St. Louis, MO USA), Thicken Up (Novartis Nutrition, Minneapolis, MN USA), and Thick & Easy (Hormel Healthlabs, Austin, MN USA). By using agglomerated forms and/or mixing them with other non-clumping powders, most of the powder forms available on the market are designed to reduce clumping and to be more likely to efficiently hydrate with mixing by hand. As will be demonstrated later, these powders do not appear to rapidly become completely hydrated. They dramatically continue to increase in viscosity for at least 90 minutes. In addition, these products adversely affect the taste and appearance of beverages so they are less appetizing to patients. For example, water thickened with any of the three products

above will be white in color and taste very starchy. Also, beverages like soda pop, human breast milk, beer and wine can not be effectively thickened with these powders. Carbonated beverages foam almost uncontrollably when these powders are added. Human breast milk contains enzymes that rapidly break these powders down. And they do not effectively thicken alcoholic beverages.

[0008] Dry powder has a potential for accidental ingestion prior to dissolution. Ingestion of dry powder can lead to swelling and blockage of the throat (Federal Register August 26, 1993, pp. 45194 – 45201). In its final ruling on the labeling of over-the-counter drugs, the United States Food and Drug Administration clearly indicates that dry thickeners in powdered form are a risk for causing esophageal obstruction. Adding to the risk, some of the patients with dysphagia have impaired decision making as a result of their primary disease.

[0009] Pre-thickened water, juices, and tea are available from several manufacturers. For example, Thick & Easy (Hormel Healthlabs, Austin, MN USA), NUTRA/Balance (Ross Products, Columbus, OH USA) and Resource (Novartis Nutrition, Minneapolis, MN USA). Pre-thickened beverages have only a limited beverage selection which includes little more than water, dairy (milk), apple juice, orange juice, cranberry juice, and tea and do not come in all three thicknesses used by the industry. Using pre-thickened beverages is an imperfect solution. Their use will still require the use of powder – either to increase beverage variety or to achieve all of the standard industry thicknesses. The taste and visual properties of pre-thickened beverages does little to improve on the powders. For example, most pre-thickened water has lemon flavor added to it to try and hide its unpleasing taste.

[0010] Current approaches to meeting the needs of people with dysphagia fall short.

SUMMARY OF THE INVENTION

[0011] In one aspect a process is provided for preparing thickener in a concentrate form that will be easily dispersed by fork or eating utensil or any other

simple method of agitation such as shaking by hand or by machine. The thickener concentrate consistently and rapidly thickens most fluids that a patient with dysphagia would desire or have a need to consume. This process provides a food thickener that is more palatable and more visually appealing, that is safer to have in the presence of patients with impaired decision making.

[0012] More specifically a process is provided for thickening a liquid food which comprises admixing an effective amount of an aqueous concentrated xanthan gum thickener composition with a liquid food which is capable of being thickened by a concentrated xanthan gum thickener composition.

[0013] In another aspect, an effective treatment for dysphagia is provided which comprises feeding a concentrate thickener composition contained within a food to a patient having the condition of dysphagia wherein the thickened liquid comprises a swallowable food.

[0014] In another aspect, a system for operating a medical facility is provided which possesses the capability of successfully treating persons afflicted with dysphagia wherein the system provides a thickened food(s) to a patient(s), wherein the thickened food(s) comprises a concentrate thickener composition.

[0015] In another aspect, a method for caring for a dysphagia patient at home or in an institution is provided by providing a thickened food of this invention wherein the thickened food comprises a concentrate thickener composition.

BRIEF DESCRIPTION OF THE DRAWINGS

[0016] Table A shows changes in actual viscosity in centipoises vs. time for human breast milk thickened with a currently available commercial product and a composition of the present invention.

[0017] Figure 1 graphically illustrates changes in actual viscosity in centipoises vs. time for human breast milk thickened with a currently available commercial product and a composition of the present invention.

[0028] Optionally, as necessary or desired, the thickener concentrate may be treated to provide shelf stability. Most commonly, but not limiting, the treatment is heat in combination with one or more of the minor components mentioned above.

[0029] The packaging of the thickener concentrate is not critical as long as it delivers an effective amount of concentrate to thicken a liquid food to a thickness effective for a person afflicted with dysphagia. Illustratively, packaging may be totes, bins, foil pouches, buckets, bags, syringes or the like.

[0030] If desired, use of a thickener concentrate will facilitate in-line mixing and preparation of thickened beverages in a beverage dispenser or container. Such a system would include a metering device and an in-line mixing system to dispense thickened beverages. It could also be designed to dispense thickened or non-thickened beverages at the turn of a switch.

[0031] In an aspect, the thickener concentrate is an effective thickener for liquid foods.

[0032] An effective amount of the aforescribed thickener concentrate is admixed with a liquid food which illustratively is selected from at least one of milk, human breast milk, cow's milk, soda, coffee, tea, juice (lemon, citrus, orange, apple), alcohol (beer, wine, or mixed drinks with less than about 20% alcohol) water, nutritional supplements, mixtures thereof and the like or a soup, broth, or food puree and the like.

[0033] As employed herein the term "juice" includes puree, fruit juices including orange juice, vegetable juice and apple juice strained and unstrained, concentrated and fresh.

[0034] Suitable vessels to effectively admix the thickener concentrate and the liquid food include drinking cups, coffee cups, bowls, household containers which can be open top or closed top, a kitchen blender, a kitchen top mixer system, as well as any suitably sized accommodable container which will accommodate the materials to be admixed. Suitable instruments to carry out the admixing include forks,

spoons, knives, hand mixers, kitchen blenders, kitchen top mixers, whisks, and any other appropriate agitation devices. Particularly suitable mixing containers have a lid or cover that can be attached to the container to allow the liquid food and thickener concentrate to be shaken together with containment.

[0035] In an exemplary process, the amount of thickener concentrate employed in the admixture is that amount which provides a thickened liquid food which is capable of being consumed by effectively swallowing by a person afflicted with dysphagia.

[0036] In an exemplary process, the amount of time employed in the immediately aforescribed admixing is in the range from about 0.01 to about 3 minutes and preferably from about 0.01 minutes to about 1.5 minutes.

[0037] Advantageously the amount of mixing time is of an order of time such that staffing in hospitals, skilled nursing facilities, nursing homes, and/or retirement homes are able to more comfortably accommodate. Also advantageously the thickened liquid food is fully thickened once the concentrate is fully diluted. No standing time is necessary as the polymer dissolution was completed during the preparation of the concentrate. These invention advantages are improvements over the current products which require a two step process during the preparation of the final foodstuff which combines mixing and standing time. These also take from about three minutes and as long as about 30 minutes or more to fully and properly thicken the liquid food.

[0038] An advantage with the inventive compositions is that they are safer to eat without adding any further liquid to them and they are safer to leave in the presence of persons with impaired mental judgment. Although certainly very viscous, consumption of the thickener concentrate without dilution does not present a choking hazard. Dry powders put in the mouth and/or attempted to be swallowed before dissolving could present a danger to a patient with impaired mental judgment. In many facilities, open containers of powder are left on tables or in rooms or individual sized packets are served on trays. If a caregiver is somehow distracted, an impulsive eater, like those, as a non-limiting example, one afflicted with Huntington's chorea,

could quickly try to consume the dry powder, at serious risk. Because they are completely hydrated, the compositions of this invention face no such problems.

[0039] Another advantage of this approach to thickening liquid foods is the consistency of preparation. When using dry powders for thickening at home or institutions, there are several factors which contribute to the variability of preparations from a dry powder.

[0040] First, most of the thickeners currently used are agglomerated products that are measured by volume. Since balances are not commonly available, solutions are prepared via the most typical and convenient means available - measuring the product by volume (i.e. 2 tablespoons per four ounces of fluid) with normal household measuring spoons. There is an unfortunate flaw in this approach because settling in the container during shipping and the breakdown of agglomerates from the scooping and leveling action of measuring each serving will tend to cause variability in the bulk density of the powder from the top to the bottom of the container. Thickness is typically logarithmically related to thickener concentration so small changes in concentration can have large differences in the thickness achieved.

[0041] Second, the manner of addition is uncontrolled and varies. Poor product addition leads to more clumping of the powder. This leads to less complete hydration for a given amount of mixing.

[0042] Third, the mixing time is an uncontrolled yet highly relevant factor. Mixing longer achieves complete hydration. However, most people do not mix long enough to achieve complete hydration. There are other activities, duties and/or patients to attend to, so they stop mixing when the solution is "thick enough". However, unhydrated particles continue to swell and thicken. This changes the final thickness as time passes and can lead to substantially over-thickened liquid foods that have to be eaten with a spoon rather than poured.

[0043] Fourth, hydration characteristics of thickeners from dry powders typically vary in different fluid environments. For example, the presence of calcium ions in a liquid food like milk may make it nearly impossible for a particular

thickener to hydrate in a reasonable time period even though it hydrates rapidly in water. Since each liquid food to be thickened represents a slightly different environment, there may be differences in thickness and in time to hydrate between different liquid foods.

[0044] The thickener concentrates of this invention overcome these aforementioned problems. The thickener concentrates of this invention are delivered to the end user fully, completely, and totally hydrated, and will not settle or separate when shipped. Its density will not change over time and is stable. Consequently the same volume of thickener concentrate will thicken a liquid food to the same level of thickness whether the thickener concentrate is from the top or the bottom of a container. Liquid foods thickened by a thickener concentrate will not continue to thicken after preparation. Since the thickener is already hydrated in the thickener concentrate, any concern over the fluid environment and its impact on hydration time is eliminated. The step of preparing thickness concentrates is quite beneficial.

[0045] A radiological technique known commonly as the modified barium swallow is used to diagnose and to make therapeutic recommendations on thickened diets to those patients afflicted with dysphagia. Currently hospitals or nursing homes or mobile diagnostic units prepare the test solutions in their own manner. There is little standardization on the thickness of these solutions. There are no means in place to ensure that the mealtime preparations served to diagnosed patients actually are the same thickness as the test preparations.

[0046] The thickener concentrate compositions of the present invention provide the opportunity to link the thicknesses prepared during the modified barium swallow to what is prepared in food service and/or bedside and/or at home. The thickener concentrate compositions of the present invention reduce the variability of final thickness in different liquid foods and reduce the variability of mixing technique. The elimination of clumping and mixing time factors will reduce the variability between what happens during a modified barium swallow and in food service and/or bedside and/or at home for actual consumption.

[0047] Another common diagnostic technique of dysphagia is the fiberoptic endoscopic evaluation of swallow. In this technique, an endoscope is insert through the patient's nasal passage into the throat to directly observe the patient's swallow function. In an aspect, thickening compositions of the present invention can be used to thicken test preparations used in this evaluation technique.

[0048] Although many thickeners are suitable for use in the present invention, the preferred thickener is xanthan gum. Xanthan gum is manufactured and sold by CP Kelco of Wilmington, DE USA as the Keltrol (R) family of products, Rhodia Food Ingredients of Cranbury, NJ as the Rhodigel family of products, and Archer Daniels, Midland Company of Decatur, IL USA. Xanthan gum is a microbial polysaccharide produced by a pure culture aerobic submerged fermentation of *Xanthomonas campestris*. Xanthan gum is comprised of a backbone of 1,4 linked D-glucose with trisaccharide side chains on alternating anhydroglucose units. The side chains are comprised of a glucuronic acid residue between two mannose units. Typically, xanthan gum forms cloudy solutions in water. Examples of useful xanthan gums include those such as Keltrol, Keltrol F, Rhodigel, Keltrol T, Keltrol RD, and Rhodigel Clear. Xanthan gum is typically available as a powder of varying suitable particle sizes.

[0049] As used herein the term "xanthan gum" includes xanthan gum and clarified xanthan gum in all different powder forms and mesh sizes.

[0050] In an exemplary process, xanthan gum and water are effectively admixed to provide a concentrate xanthan gum thickener having about 2% to about 5%, specifically about 3.5% to about 4.5% and more specifically about 3.6% to about 4.3% xanthan gum content. The xanthan gum concentrate has the visual appearance and physical consistency of a thick paste or jelly, similar to hair gel, lotions, and honey at about (72°F) room temperature.

[0051] Employing the preferred xanthan gum concentrate to thicken liquid food is advantageous in terms of flavor, and taste, thereby promoting better hydration and nutrition. Employing clarified xanthan gum is also advantageous in appearance. The current commercially available products comprise starch and impart

an off-flavor to many beverages. This discourages consumption of an adequate amount of liquids. Employing the preferred compositions of this invention encourages greater consumption of liquids by persons afflicted with dysphagia. Patients will drink more and thereby maintain adequate hydration. This improves the patient's health, happiness, and lifestyle.

[0052] Although the compositions of the present invention are most useful and advantageous to those with dysphagia, they have benefits in other areas. People who suffer from celiac's disease can not tolerate foods with gluten in it. Gluten typically comes from grains like wheat or corn and they can not use common household corn starch to thicken their foods like soup. Other thickeners are recommended. Also gluten-free recipes for breads and the like often specify the addition of xanthan gum due to its ability to keep breads moist. Again the most commonly available substitutes are powders, which are difficult at best to properly disperse and hydrate. Without proper dispersion and hydration, the effectiveness of these powders is limited. But the use of a thickener concentrate is extremely effective because the thickener is already completely dispersed and hydrated.

[0053] Children are often attracted to novelty treats. With the addition of sugar or other sweeteners, flavors, colors, and/or an insoluble novelty, in an aspect, the compositions of the present invention could be used as a novelty treat for children.

[0054] Although exemplary embodiments of processes are described herein, processes are not limited to such exemplary embodiments.

EXAMPLES OF THE INVENTION

[0055] Examples 1-33 following demonstrate that effective thickener concentrates can be prepared from different thickening agents.

[0056] In Examples 1-10 following, a 4% w/w solution of clarified xanthan gum from was prepared in water in the following manner. 22.47 g of clarified xanthan gum (composing of 89% clarified xanthan gum and 11% water) was

added to 477.53 g of tap water under agitation. The solution was mixed for about one hour and no undissolved particles or fish eyes were visible.

[0057] In Examples 1-5 following, a 1% w/w solution of xanthan gum was prepared by from the concentrate in the following manner: 50.0 g of 4% xanthan gum in water was added to 150.0 g of each fluid and agitated gently for less than 5 minutes. Each thickened liquid food was qualitatively analyzed to whether it was thick enough to be of honey consistency. All thickened liquid foods were visually appealing and tasted better than a control made with a competitive starch product.

Example	Liquid Food	Honey Consistency?
1	Tap Water	Yes
2	Apple Juice	Yes
3	Cranberry Juice	Yes
4	Orange Juice	Yes
5	Milk	Yes

[0058] In Examples 6-10 following, the compositions of Examples 1-5 were mixed with an equal unthickened portion of the same liquid food and were qualitatively evaluated whether they were more of a honey or nectar consistency. All thickened liquid foods were visually appealing and tasted better than a control made with a commercially available starch product.

	Liquid Food	Honey Consistency?	Nectar Consistency?
6	Tap Water	No	Yes
7	Apple Juice	No	Yes
8	Cranberry Juice	No	Yes
9	Orange Juice	No	Yes
10	Milk	No	Yes

[0059] In Examples 11-18 following, a 4% thickener concentrate was prepared with clarified xanthan gum. The paste was divided into aliquots of 25 mL or 10 mL in plastic bags. The plastic bags were heat sealed and the packets were heat pasteurized. Packets were emptied into the fluid at a rate of one packet per 4 oz. of liquid food. Various agitation methods were tried and the consistency was subjectively evaluated. All thickened liquid foods were visually appealing and tasted better than a control made with a commercially available starch product.

Example	Liquid Food	Packet Size	Agitation	Consistency
11	Tap Water	10 mL	Fork	Nectar
12	Tap Water	25 mL	Fork	Honey
13	Tap Water	10 mL	Shaking	Nectar
14	Tap Water	25 mL	Shaking	Honey
15	Apple Juice	25 mL	Shaking	Honey
16	Orange Juice	25 mL	Shaking	Honey
17	Coffee	10 mL	Fork	Nectar
18	Pepsi One	25 mL	Shaking	Honey

[0060] For Examples 19–26 following, a thickener concentrate of carboxymethylcellulose sodium was prepared by admixing 10 g of carboxymethylcellulose sodium with 490 g of tap water. The concentrate was admixed with a blender and allowed to stand for approximately 20 minutes. No undissolved particles were observed. Portions of the concentrate were admixed with water, apple juice, and cranberry juice cocktail for a few seconds with an electric blender. All admixtures were thickened after this mixing and no standing was required. Their consistency was then evaluated by their feel in the mouth and how they flowed when poured on a flat surface.

Example	Amount of Concentrate (g)	Amount of liquid (g)	Liquid Food	Thickness
19	10	120	Water	Nectar
20	12	120	Apple Juice	Nectar
21	15	120	Cranberry Juice Cocktail	Nectar
22	35	120	Water	Honey
23	75	120	Water	Pudding
24	41	120	Apple Juice	Nectar
25	60	120	Apple Juice	Honey
26	75	120	Cranberry Juice Cocktail	Honey

[0061] For Examples 27–33 following, a thickener concentrate of fine mesh guar gum was prepared by admixing 10 g of guar gum 390 g of tap water. The concentrate was admixed with a blender and allowed to stand for approximately 50 minutes. No undissolved particles were observed. Portions of the concentrate were admixed with water, apple juice, and cranberry juice cocktail for a few seconds with an electric blender. All admixtures were thickened after this mixing and no standing was required. Their consistency was then evaluated by their feel in the mouth and how they flowed when poured on a flat surface.

Example	Amount of Concentrate (g)	Amount of liquid (g)	Liquid Food	Thickness
27	30	120	Water	Nectar
28	75	120	Water	Honey
29	40	40	Water	Pudding
30	34	120	Apple Juice	Nectar
31	34	120	Cranberry Juice Cocktail	Nectar
32	80	120	Cranberry Juice Cocktail	Honey
33	60	90	Apple Juice	Honey

EXAMPLE 34

[0062] This example demonstrates that the thickener concentrates of this invention have reduced changes in viscosity over time and that they have less variability in final thickness. Eight ounces of honey consistency beverages were prepared with a commercially available starch thickener, Thick-It (Precision Foods, St. Louis, MO USA) by following the manufacturer's directions on the can. 5 tablespoons of powder was added to each beverage and mixed for a few seconds with a whisk. Each thickened liquid food was allowed to stand for at least 30 seconds. The thickened liquid foods were prepared in water, apple juice, cranberry juice cocktail, prune juice and orange juice.

[0063] A thickener concentrate was prepared with 3.75% clarified xanthan gum, 0.25% citric acid, 0.1% sodium benzoate, and 0.1% potassium sorbate.

This was heat processed for shelf stability and packaged in 25 g aliquots into foil pouches. Nine months later, two of these packets were added to 8 oz. of each of water, apple juice, cranberry juice cocktail, prune juice and orange juice. They were mixed with a kitchen whisk for less than 90 seconds.

[0064] The viscosity of all thickened liquid foods was monitored with a Brookfield RV viscometer at 50 rpm with the appropriate spindle. The data were indexed to a viscosity of 100 at the time the beverage was ready for consumption. In the case of Thick-It, this was after the 30 seconds of standing. With the thickener composition prepared with xanthan gum, this was immediately after mixing was completed. The indexed viscosity data after 90 minutes is as follows:

	Thick-It	Xanthan Concentrate
Apple Juice	285.0	153.8
Cranberry Juice Cocktail	397.3	120.3
Orange Juice	270.8	129.2
Prune Juice	166.1	112.1
Water	185.7	101.5
Mean	261.0	123.4
Standard Deviation	92.1	19.8
St. Dev as % of Mean	35%	16%

[0065] When thickened with the compositions of the invention, the thickened liquid foods on average, increased in viscosity by only about 23%. When using Thick-It, the viscosity increased by over about 160%. The compositions of the invention show far less change in viscosity over time.

[0066] In addition, the standard deviation, a measure of the variability of the viscosities of the thickened liquid foods, was reduced more than in half as a % of the mean. The variation in viscosity of different thickened liquid foods when using the compositions of the present invention is reduced.

EXAMPLE 35

[0067] The following example demonstrates the benefits of the preferred thickener concentrates in terms of preference, taste, and appearance. By improving these characteristics, patients will consume greater quantities of beverage.

[0068] In this Example, fourteen human patients of a long-term care facility were offered water and orange juice thickened with a commercial product, Thicken Right (Manufactured by Diamond Crystal Specialty Foods USA). In addition, they were offered water and orange juice thickened with compositions of the invention. A thickener concentrate was prepared with 3.75% clarified xanthan gum, 0.25% citric acid, 0.1% sodium benzoate, and 0.1% potassium sorbate. This was heat processed for shelf stability and packaged in either 10 g or 25 g aliquots in foil pouches. After three months, the packets were added to the liquid foods at a rate of one packet per 4 oz. of liquid food and agitated with a whisk to achieve thickening. Patients on a nectar-consistency diet were given liquid foods thickened with the 10 g aliquots. Patients on a honey-consistency diet were given liquid foods thickened with the 25 g aliquots.

[0069] After evaluating the beverages in several characteristics, the patients were asked which product they preferred. Overall 21 of 28 times, liquid foods thickened with compositions of this invention were stated as the preferred liquid food. Thirteen respondents stated that they preferred the water thickened with the composition of this invention and 8 of 14 respondents preferred orange juice thickened with the composition of this invention. These results are statistically significant when analyzed with statistical software.

[0070] In addition, the patients' responses to various statements were recorded. Their responses were analyzed with a paired t-test with statistical software. The results showed statistically significant higher ratings for liquid foods thickened with compositions of the invention than those for Thicken Right. In no cases were Thicken Right thickened liquid foods rated higher than those thickened with compositions of the present invention. In such an analysis, the strength of the statistical significance is represented by the p-value. A lower p-value means stronger

statistical significance. Typically, any p-value of 0.05 or less is considered statistically significant. The questions and the associated p-values were:

1. I would enjoy drinking this liquid food as part of my everyday diet. (p=0.002)
2. The liquid food taste was pleasing. (p=0.005)
3. The liquid food appears appetizing. (p=0.006)
4. The liquid food appearance was pleasing. (p=0.000)
5. The liquid food looks like it should. (p=0.006)
6. The liquid food looks like the consistency intended. (p=0.011)
7. The texture of this liquid food is smooth and palatable. (p=0.004)
8. The liquid food has no unappealing smells. (p=0.014)
9. The liquid food has no lumps. (p=0.008)
10. The texture of this liquid food looks smooth. (p=0.014)

[0071] This demonstrates the very strong appeal of the present compositions to dysphagia patients.

EXAMPLE 36

[0072] In this example, fresh human breast milk was frozen, thawed and thickened. Thickened human breast milk compositions were prepared with two different thickeners. One was a xanthan gum thickener concentrate and the other was Thick-It. Four ounce samples of breast milk were mixed with the appropriate amount of each of the aforementioned thickeners to produce a honey-like physical consistency. Viscosity data was measured with a Brookfield RV viscometer at 50 rpm with the appropriate spindle as time progressed after preparation. The data are presented in Table A below, where A is the breast milk from human 1 and B is the breast milk from human 2.

Table A:
Viscosity (cP)

Time (hour:min:sec)	B Thick-It	A Thick-It	B Concentrate	A Concentrate
0:01:00		1,183	774	798
0:02:00	3,544	880	---	---
0:02:30			772	812
0:05:00	2,048	160	790	814
0:07:30	968	57	804	820
0:10:00	434	46	800	820
0:12:30	234	---	---	---
0:15:00	113	---	812	840
0:17:30	64	---	---	---
0:20:00	49	---	---	---
0:30:00	---	---	826	848
0:45:00	---	---	820	848
1:00:00	---	---	822	842

Figure 1. Tabulated viscosity data as a function of time in human breast milk

[0073] With Thick-It, the viscosity of the breast milk from B decreased by 98.6% in 20 minutes and the viscosity of breast milk from A decreased by 96.1% in 10 minutes. With the thickener concentrate, the viscosity of the breast milk from B increased 6.2% in 60 minutes and the viscosity of the breast milk from A increased 5.5% in 60 minutes.

[0074] Figure 2 shows the actual viscosity data. The Figure 3 shows the effects when the results are indexed to the viscosity at time 00:00 = 100.

EXAMPLE 36

[0075] To further demonstrate the effectiveness of the xanthan thickener concentrate in human breast milk, the samples from Example 35 thickened with the xanthan concentrate were frozen. Six days later, the frozen samples were allowed to thaw in a refrigerator. Two days later they were warmed to room temperature and their viscosity was measured again. The samples showed no signs of separation when the samples were opened. The viscosity of the B breast milk thickened with the xanthan concentrate was 868 cP and the A breast milk thickened with the xanthan concentrate was 920 cP. (cP = centipoise.)

[0076] The xanthan gum thickener concentrate thickens human breast milk and maintains the thickness without significant changes in consistency.

This is true even when frozen for six days and refrigerated for another two days. This is a dramatic improvement over existing technology where thickness is not maintained for even 20 minutes.

[0077] Examples 37 and 38 demonstrate that the improved taste and appearance of a xanthan gum concentrate increases the quantity of fluid consumed by dysphagia patients and dramatically improves their quality of life and their health.

EXAMPLE 37

[0078] A 78-year old Parkinson's patient with a history of nearly a year of nearly continuous lung infections had been advised to thicken his liquid foods to avoid future infections. Because of he found powder thickeners unpalatable, he was consuming virtually no liquid foods. This led to poor oral hygiene, which led with rapid bacteria growth in the mouth, and thick stringy saliva. The bacteria in the mouth was the suspected source of the lung infections.

[0079] A thickener concentrate was prepared with 3.75% clarified xanthan gum, 0.25% citric acid, 0.1% sodium benzoate, and 0.1% potassium sorbate. This was heat processed for shelf stability and packaged in 10 g aliquots into foil pouches. Initially water and iced tea was thickened at a rate of one 10 g packet per 4 oz of beverage. Later, the composition was added to whatever beverage the patient wanted to consume.

[0080] Within 3 days of first being offered liquid foods thickened with the above composition, the patient was drinking 2 quarts of water per day. The patient has not had any new infections within 4 months of follow up.

EXAMPLE 38

[0081] After a series of respiratory infections were linked to aspiration of liquid foods, a 5 year old boy was placed on a diet with all liquid foods thickened. However, he would not drink beverages prepared with powdered starches for two reasons. First he reported that he hated the taste. Second, he reported that he hated the powder lumps. Because he would not drink thickened liquid foods, his

growth and nutritional status suffered. He was first fitted with a naso-gastric tube to provide sufficient liquid foods and to supplement his solids. Eventually a gastrostomy tube was inserted. For over a year, he was fed liquid foods through the gastrostomy tube 3-5 times per day to ensure proper hydration and nutrition. During this time, he would not drink liquid foods thickened with commercially available powders.

[0082] A thickener concentrate was prepared with 3.75% clarified xanthan gum, 0.25% citric acid, 0.1% sodium benzoate, and 0.1% potassium sorbate. This was heat processed for shelf stability and packaged in 25 g and 10 g in foil pouches.

[0083] Approximately 5 months after preparation, the 25 g pouches were used to thicken liquid foods for the boy to honey-consistency by adding them at a rate of one pouch for every 4 oz of liquid food. He began to drink thickened liquid foods orally and his dependence on tube feedings began to decrease.

[0084] After approximately 1 month, a new modified barium swallow was conducted that concluded he could progress to nectar-consistency fluids. At this point he began using the 10 g pouches at a rate of one pouch per 4 oz of liquid food. He continued to increase his oral liquid food intake and decrease his need for supplementation through his tube.

[0085] After approximately another 4-6 weeks, supplementation through his tube was no longer necessary and the tube was removed. At last contact, he continues to have all his liquid foods thickened with the compositions of the present invention and continues to consume sufficient liquid foods orally.

[0086] While the invention has been described in terms of various specific embodiments, those skilled in the art will recognize that the invention can be practiced with modification within the spirit and scope of the claims.

WHAT IS CLAIMED IS:

1. A process for thickening a liquid food which comprises admixing an effective amount of an aqueous concentrate thickener composition with a liquid food which is capable of being thickened by a concentrate thickener composition.
2. A process in accordance with Claim 1 wherein said concentrate thickener is selected from at least one of alginates (sodium, potassium, and ammonium salts), carrageenan, gactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulotics (carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches, xanthan gum and gum arabic.
3. A process in accordance with Claim 2 wherein said concentrate thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.
4. A process in accordance with Claim 3 wherein said concentrate thickener comprises xanthan gum.
5. A process in accordance with Claim 2 wherein the xanthan gum comprises a dilutable concentrate.
6. A process in accordance with Claim 3 wherein the concentrate thickener composition is a jelly.
7. A process in accordance with Claim 3 wherein the concentrate thickener composition is a highly viscous liquid.
8. A process in accordance with Claim 4 wherein the concentrate thickener composition has the visual appearance of honey.
9. A process in accordance with Claim 1 wherein said food is a liquid based on water.

10. A process in accordance with Claim 1 wherein the liquid is selected from at least one of milk, soda, coffee, tea, juice, water, beer, wine and nutritional supplements.

11. A process in accordance with Claim 1 wherein the food is a food with a substantial amount of unbound liquid.

12. A process in accordance with Claim 11 wherein the food with a substantial amount of unbound liquid is selected from at least one of a broth, soup, stew, puree of solid food and a liquid, and a puree of high liquid foods.

13. A process in accordance with Claim 5 wherein said xanthan gum composition comprises from about 2% to about 5 % xanthan gum by weight.

14. A process in accordance with Claim 13 wherein said xanthan gum composition comprises from about 3.5% to about 4.5 % xanthan gum.

15. A process in accordance with Claim 14 wherein said xanthan gum composition comprises from about 3.6% to about 4.3% xanthan gum.

16. A process for thickening a barium sulfate composition which comprises admixing a thickening amount of an aqueous concentrate thickener composition with said barium sulfate composition.

17. A process in accordance with Claim 16 wherein said thickener concentrate is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, glactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulose (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, hydroxypropyl methyl cellulose), food starches, xanthan gum and gum arabic.

18. A process in accordance with Claim 17 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

19. A process in accordance with Claim 18 wherein the concentrate thickener comprises a xanthan gum.

20. A process in accordance with Claim 19 wherein said xanthan gum composition comprises about 2% to about 5% xanthan gum.

21. A process in accordance with Claim 20 wherein said xanthan gum comprises about 3.5% to about 4.5% xanthan gum.

22. A process in accordance with Claim 21 wherein said xanthan gum comprises about 3.6% to about 4.3%.

23. A process in accordance with Claim 14 wherein said barium sulfate is used for a medicinal purpose.

24. A treatment for dysphagia which comprises feeding an aqueous concentrate thickener composition contained within a food to a patient having the condition of dysphagia.

25. A process in accordance with Claim 24 wherein said concentrate thickener is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulose (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches xanthan gum and gum arabic.

26. A process in accordance with Claim 25 wherein said concentrate thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

27. A treatment in accordance with Claim 26 wherein the concentrate thickener composition is a liquid which comprises xanthan gum.

28. A treatment in accordance with Claim 27 wherein the food is a liquid and the dysphagia patient swallows the thickened food.

29. A treatment in accordance with Claim 28 wherein said liquid is selected from milk, soda, coffee, tea, juice, water, beer, wine, and nutritional supplement.

30. A treatment in accordance with Claim 28 wherein the food is a food with a substantial amount of unbound liquid.

31. A treatment in accordance with Claim 30 wherein the food with a substantial amount of unbound liquid is selected from broths, soups, stews, purees of solid food and a liquid, and purees of high liquid content foods.

32. A treatment in accordance with Claim 27 wherein said xanthan gum composition comprises about 2% to about 5% xanthan gum.

33. A treatment in accordance with Claim 32 wherein said xanthan gum composition comprises about 3.5% to about 4.5% xanthan gum.

34. A treatment in accordance with Claim 33 wherein said xanthan gum composition comprises about 3.6% to about 4.3% xanthan gum.

35. A system for operating a medical facility possessing the capability of treating persons afflicted with dysphagia wherein said facility provides thickened foods to the patients and wherein the thickened food comprises an aqueous thickener concentrate composition.

36. A process in accordance with Claim 35 wherein said concentrate thickener is selected from at least one of alginates (sodium, potassium, and ammonium salts), carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulose (carboxymethylcellulose sodium, hydroxypropylcellulose and/or hydroxypropylmethylcellulose), food starches, xanthan gum, and gum arabic.

37. A process in accordance with Claim 36 wherein said concentrate thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

38. A system in accordance with Claim 37 wherein said concentrate thickener composition is a concentrate of xanthan gum.

39. A system in accordance with Claim 38 wherein said concentrate comprises about 2% to about 5% xanthan gum.

40. A system in accordance with Claim 39 wherein said concentrate comprises about 3.5 % to about 4.5% xanthan gum.

41. A system in accordance with Claim 40 wherein said concentrate comprises about 3.6 % to about 4.3% xanthan gum.

42. A process for treating patients of dysphagia at home, said process comprising feeding said patients an aqueous concentrate thickener composition.

43. A process in accordance with Claim 42 wherein said thickener is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, glactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulosics (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches, xanthan gum and gum arabic.

44. A process in accordance with Claim 43 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

45. A system in accordance with Claim 44 wherein said concentrate thickener composition is a concentrate of xanthan gum.

46. A system in accordance with Claim 45 wherein said concentrate comprises about 2% to about 5% xanthan gum.

47. A system in accordance with Claim 46 wherein said concentrate comprises about 3.5 % to about 4.5% xanthan gum.

48. A system in accordance with Claim 47 wherein said concentrate comprises about 3.6 % to about 4.3% xanthan gum.

49. A process improving patient fluid consumption by providing said patients with a food thickened with an aqueous thickener concentrate.

50. A process in accordance with Claim 49 wherein said thickener is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulose (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches, xanthan gum, and gum arabic.

51. A process in accordance with Claim 50 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

52. A system in accordance with Claim 51 wherein said concentrate thickener composition comprises xanthan gum.

53. A system in accordance with Claim 52 wherein said concentrate comprises about 2% to about 5% xanthan gum.

54. A system in accordance with Claim 53 wherein said concentrate comprises about 3.5 % to about 4.5% xanthan gum.

55. A system in accordance with Claim 54 wherein said concentrate comprises about 3.6 % to about 4.3% xanthan gum.

56. A process for reducing the time in the preparation of a beverage, said process comprising admixing with said beverage an aqueous thickener concentrate.

57. A process in accordance with Claim 56 wherein said thickener is selected from at least one of alginates (sodium, potassium and ammonium salts), carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum),

cellulosics (carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches, xanthan gum and gum arabic.

58. A process in accordance with Claim 57 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium and xanthan gum.

59. A system in accordance with Claim 58 wherein said concentrate thickener composition is a concentrate of xanthan gum.

60. A system in accordance with Claim 59 wherein said concentrate comprises about 2% to about 5% xanthan gum.

61. A system in accordance with Claim 60 wherein said concentrate comprises about 3.5 % to about 4.5% xanthan gum.

62. A system in accordance with Claim 61 wherein said concentrate comprises about 3.6 % to about 4.3% xanthan gum.

63. A process for increasing beverage variety by admixing said beverage with an aqueous thickener concentrate.

64. A process in accordance with Claim 63 wherein said thickener is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulosics (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), food starches xanthan gum and gum arabic.

65. A process in accordance with Claim 64 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose sodium, and xanthan gum.

66. A system in accordance with Claim 65 wherein said concentrate thickener composition comprises xanthan gum.

67. A system in accordance with Claim 66 wherein said concentrate comprises about 2% to about 5% xanthan gum.

68. A system in accordance with Claim 67 wherein said concentrate comprises about 3.5 % to about 4.5% xanthan gum.

69. A system in accordance with Claim 68 wherein said concentrate comprises about 3.6 % to about 4.3% xanthan gum.

70. A process for improving the appearance of thickened liquid foods, said process comprising admixing an effective amount of an aqueous concentrate thickener with a liquid food which is capable of being thickened by a concentrate thickener composition.

71. A process in accordance with Claim 70 wherein said thickener is selected from at least one of carrageenan, galactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulosics (carboxymethylcellulose sodium, hydroxy propyl, cellulose, and/or hydroxypropylmethylcellulose), food starches, xanthan gum and gum arabic.

72. A process in accordance with Claim 71 wherein said concentrate thickener comprises xanthan gum.

73. A process in accordance with Claim 72 wherein said xanthan gum composition comprises from about 2% to about 5 % xanthan gum by weight.

74. A process in accordance with Claim 73 wherein said xanthan gum composition comprises from about 3.5% to about 4.5 % xanthan gum.

75. A process in accordance with Claim 74 wherein said xanthan gum composition comprises from about 3.6% to about 4.3% xanthan gum.

76. A process in accordance with Claim 71 wherein said thickener is selected from at least one of carrageenan, guar gum, carboxymethylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose and xanthan gum.

77. A process for thickening human breast milk, said process comprising admixing said human breast milk with an effective amount of an aqueous thickener concentrate.

78. A process in accordance with Claim 77 where said thickener is selected from at least one of alginates (sodium, potassium, or ammonium salts), carrageenan, gactomannans (guar gum, locust bean gum, and/or carob bean gum), cellulotics (sodium carboxymethylcellulose sodium, hydroxypropyl cellulose, and/or hydroxypropyl methyl cellulose), xanthan gum and gum arabic.

79. A process in accordance with Claim 78 wherein said thickener is selected from at least one of guar gum, carrageenan, and xanthan gum.

80. A process in accordance with Claim 79 wherein said concentrate thickener comprises xanthan gum.

81. A process in accordance with Claim 80 wherein said xanthan gum composition comprises from about 2% to about 5 % xanthan gum by weight.

82. A process in accordance with Claim 81 wherein said xanthan gum composition comprises from about 3.5% to about 4.5 % xanthan gum.

83. A process in accordance with Claim 82 wherein said xanthan gum composition comprises from about 3.6% to about 4.3% xanthan gum.
